

Booking, online and in three languages.

A public booking page for Deepan Hospital and a reception screen behind it. It sits in front of Klinique — it does not replace it, and it does not touch the clinical record. This document describes what has been built, what is still needed, and what happens next.

The problem it solves

Today a patient who wants an appointment at Deepan Hospital has to telephone, during working hours, and speak to somebody at the counter. There is no other way in. Someone deciding at eleven at night, or who would rather read Tamil than speak English to a stranger, or who simply cannot get through, goes to whichever hospital they can reach first.

Klinique holds the hospital's clinical record and does that job well, but it has no public page — a patient cannot reach it. That gap is what this fills.

What it does

18 consultants listed	21 departments	3 languages, every screen	24/7 bookings accepted
---------------------------------	--------------------------	-------------------------------------	----------------------------------

FOR THE PATIENT

Books in about a minute, with no account

Choose a department or a doctor, see the real free times, book. No app to download and nothing to sign up for — an account is offered, never required.

Every screen in English, Tamil and Hindi

Not a translated front page with English underneath: the whole site, including the booking form, the fees, the departments and the appointment slip.

Sees the fee before booking

Each consultant's fee, days and consulting hours are shown as the hospital records them, so nobody arrives expecting a different number.

Gets the appointment in writing

Reference, doctor, date, time and the hospital's address, sent by WhatsApp or SMS in the patient's own language.

Bookings arrive on their screen by themselves

With a chime and an on-screen alert. Nobody types anything, and no booking waits for somebody to check an inbox.

The slot is held the moment a patient books

Two patients cannot take the same time. The database enforces it, not the screen — so it holds even if two people book in the same second.

Booking for a caller is faster than the register

The free times for any doctor on any date, one tap to hold one, and a reference to read back to the caller.

A worklist for Klinique, with a tick

Every booking to be entered, each field one tap to copy, and a record of which have been done — so none is entered twice or missed.

It does not compete with Klinique

There is deliberately no second place to write a prescription or a consultation note. Two records that can disagree about one patient is a real danger, and avoiding it was worth more than the convenience. Klinique stays the clinical record; this is the booking page in front of it.

Where it stands

Stated plainly, including what is not finished. Nothing below is a promise about future work.

ITEM	STATE	NOTE
Patient booking, three languages	BUILT	15 of 18 consultants bookable; the rest take callback requests
Reception desk	BUILT	Live bookings, schedules, callbacks, follow-ups, alerts
Klinique worklist	BUILT	Entered by hand today; see below
Written confirmation to patients	BUILT	Sent by reception in one tap, from their own phone
Staff manual	WRITTEN	Supplied with this document
Automatic transfer into Klinique	NEEDS KLINIQUE	Built and ready; needs an API key or one captured form
Automatic SMS to patients	NEEDS THE HOSPITAL	DLT registration in the hospital's name
Medical registration numbers	NEEDS THE HOSPITAL	None of the 18 on file; shown publicly beside qualifications
Accreditation claim	NOT MADE	Deliberately absent until the register entry is confirmed
Live on the internet	NOT YET	Domain, secure hosting and off-site backups

On accreditation and registration numbers

The site makes no NABH claim, and every consultant's registration field has been left empty rather than filled in with a plausible guess. Both are the hospital's to confirm from its own records. An unverified claim on a hospital's public site is the kind of thing that is cheap to avoid now and expensive to explain later.

What is needed from the hospital

Five things, none of which can be supplied from outside. The first two are what stand between today and going live.

1

A domain name and hosting

Registered in the hospital's name, not a supplier's. Patient data and the hospital's own address should never sit in somebody else's account.

2

Medical registration numbers for all 18 consultants

From the hospital's records. These appear publicly beside each doctor's qualification.

3

Confirmation of the consulting hours and fees

They were transcribed from the hospital's own OP list. Somebody should read them once before patients start booking against them.

4

A decision on who texts the patient

Klinique's booking form can already send an SMS confirmation. If the hospital would rather it did so, that is the simpler route and reception need do nothing.

5

A named person for data questions

Required under the Digital Personal Data Protection Act 2023 — a patient must have somebody to write to. A name and an email address is enough.

Next steps

Two phases. The first is short, because most of the work is done.

Phase one — go live

Domain, secure hosting, off-site backups, the registration numbers entered, hours and fees confirmed, and reception trained on the manual. The site is then open to patients.

Phase two — remove the typing

Bookings pass into Klinique automatically instead of being entered by hand. Needs either an API key from Klinique or one booking captured from their own form. Quoted separately, because it depends on what Klinique will provide.

Suggested first step

Bring two or three departments live for a fortnight rather than the whole roster at once. Reception learns the screen on a small volume, the hospital sees real bookings before committing further, and the remaining departments are opened by ticking a box.

Prepared for Dr Deepan G, Deepan Hospital.
